

Executive Summary

NewsBot Intelligence System is an automated news analysis platform that reads a news article and, within seconds, returns its category, emotional tone, key people and organizations mentioned, a short summary, and (when needed) a translation into another language. It is built entirely with open-source natural language processing tools and requires no manual review of the articles it processes.

Organizations that track news coverage face a volume problem: far more articles are published every day than any team can realistically read, categorize, and summarize by hand. Manually sorting articles by topic, gauging their tone, and pulling out the people and companies involved is slow, inconsistent between reviewers, and does not scale as the volume of coverage grows. NewsBot addresses this by combining multiple NLP components:

- ✧ Classification
- ✧ Sentiment analysis
- ✧ Entity recognition
- ✧ Summarization
- ✧ Language detection and translation

Use cases:

- ✧ Media monitoring
- ✧ Investment research
- ✧ Newsroom support
- ✧ Cross-market research
